December 2006

DETECTING INTERFACES IN A PARABOLIC-ELLIPTIC PROBLEM FROM SURFACE MEASUREMENTS

FLORIAN FRÜHAUF[†], BASTIAN GEBAUER[‡], OTMAR SCHERZER[†]

Abstract. Assuming that the heat capacity of a body is negligible outside certain inclusions the heat equation degenerates to a parabolic-elliptic interface problem. In this work we aim to detect these interfaces from thermal measurements on the surface of the body.

We deduce an equivalent variational formulation for the parabolic-elliptic problem and give a new proof of the unique solvability based on Lions' projection lemma. For the case that the heat conductivity is higher inside the inclusions, we develop an adaptation of the Factorization Method to this time-dependent problem. In particular this shows that the locations of the interfaces are uniquely determined by boundary measurements. The method also yields to a numerical algorithm to recover the inclusions and thus the interfaces.

We demonstrate how measurement data can be simulated numerically by a coupling of a finite element method with a boundary element method and finally we present some numerical results for the inverse problem.

1. Introduction. We consider the heat equation in a domain $B \subset \mathbb{R}^n$

(1.1)
$$\partial_t(c(x)u(x,t)) - \nabla \cdot (\kappa(x)\nabla u(x,t)) = 0 \quad \text{in } B \times]0,T[,$$

with (spatially dependent) heat capacity c and conductivity κ . The special case we are studying here is that the heat capacity c(x) is bounded from below inside an inclusion $\overline{\Omega} \subset B$, and negligibly small on the outside $Q := B \setminus \overline{\Omega}$ (cf. figure 1.1 for a sketch of the geometry). Throughout this work Ω is allowed to be disconnected, thus the case of multiple inclusions is covered as well.

If we assume for simplicity that $c(x) = \chi_{\Omega}(x)$ is the characteristic function of Ω , then the evolution equation (1.1) can be rewritten as a parabolic-elliptic equation

(1.2)
$$\partial_t u(x,t) - \nabla \cdot (\kappa(x) \nabla u(x,t)) = 0 \text{ in } \Omega \times]0, T[,$$

(1.3)
$$\nabla \cdot (\kappa(x) \,\nabla u(x,t)) = 0 \text{ in } Q \times]0, T[,$$

together with appropriate interface conditions on $\partial \Omega$.

For the case $B = \mathbb{R}^2$ and $\kappa = 1$ this problem also arises in the study of two-dimensional eddy currents and was studied by MacCamy and Suri in [23] and by Costabel, Ervin and Stephan in [9]. In both papers boundary integral operators are used to replace the Laplace equation in the exterior of Ω by a non-local boundary condition for the

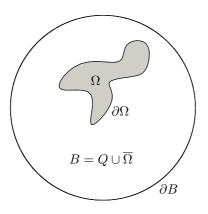

FIG. 1.1. Sketch of geometry

parabolic equation inside Ω . This problem is then solved by a Galerkin method. In [8] Costabel uses boundary integral operators also to solve the resulting interior problem.

In this work we study the problem for general $\kappa \in L^{\infty}_{+}(B)$ in a bounded domain B with given Neumann boundary values on ∂B . By considering equation (1.1) in the sense of distributions we deduce (1.2), (1.3) together with natural interface conditions (that would otherwise have to be postulated). Moreover, we prove that the weak formulation in appropriate Sobolev spaces is equivalent to (1.1). We show existence of a unique solution using Lions' projection lemma, cf. Section 2.

In Section 3 we study the inverse problem of locating the interface $\partial\Omega$ resp. the inclusion Ω from surface measurements on ∂B . If the conductivity is larger inside Ω than in the exterior Q, we show that the points belonging to Ω can be characterized using a variant of the so-called Factorization Method introduced by Kirsch in [16], generalized by Brühl and Hanke in [6, 5] and since then adapted to various stationary and time-harmonic problems, cf. [1, 2, 7, 15, 17, 18, 19] for more recent contributions. To our knowledge this is the first successful extension of this method to a time-dependent problem.

In Section 4 we show how the direct problem can be solved numerically with a coupling of finite element methods and boundary element methods similar to [23]. Using simulated measurements we demonstrate the numerical realization of the Factorization Method following the ideas of Brühl and Hanke in [6, 5].

2. The direct problem.

2.1. A parabolic-elliptic problem. Let T > 0 and $\Omega, B \subset \mathbb{R}^n, n \geq 2$, be bounded domains with smooth boundaries, $\overline{\Omega} \subset B$ and connected complement $Q := B \setminus \overline{\Omega}$.

In this section we study the parabolic-elliptic problem

(2.1)
$$\partial_t(\chi_{\Omega}(x)u(x,t)) - \nabla \cdot (\kappa(x)\nabla u(x,t)) = 0 \quad \text{in } B \times]0, T[,$$

with $\kappa \in L^{\infty}_{+}(B)$, where we denote by L^{∞}_{+} the space of L^{∞} -functions with positive essential infima, and χ_{Ω} is the characteristic function of Ω .

A standard way to treat an equation like (2.1) is to multiply both sides with a test function followed by a formal partial integration. Assuming additional (also formal) boundary and initial conditions this leads to a variational formulation, which is mathematically meaningful in some Sobolev spaces (thus no longer formal). Instead of equation (2.1) one would then study this variational formulation, the so-called weak form of the equation.

In this work we proceed in a slightly different way. We start by noting that the lefthand side of (2.1) does have a mathematical meaning for every $u \in L^2(0, T, H^1(B))$ if the derivatives are interpreted in the sense of (scalar-valued) distributions.

We denote by $\mathcal{D}(B \times]0, T[)$ the space of infinitely often differentiable functions with support in $B \times]0, T[$ and by $\mathcal{D}'(B \times]0, T[)$ its dual space, i.e. the space of distributions on $B \times]0, T[$. By the definition of distributional derivatives, equation (2.1) is equivalent to

(2.2)
$$-\int_0^T \int_\Omega u(x,t) \partial_t \varphi(x,t) \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \int_B \kappa(x) \, \nabla u(x,t) \cdot \nabla \varphi(x,t) \, \mathrm{d}x \, \mathrm{d}t = 0$$

for all $\varphi \in \mathcal{D}(B \times]0, T[)$.

We will show in this section that equation (2.1) (together with appropriate boundary and initial conditions) has a unique solution in $L^2(0, T, H^1(B))$. In Theorem 2.6 we give an equivalent variational formulation in Sobolev spaces, using the time-derivative in the sense of vector-valued distributions (which we denote by u'). This variational formulation is the same that one would have obtained as the weak generalization of (2.1) using the above mentioned formal arguments.

We denote by ν the exterior normal on ∂B resp. the exterior normal on $\partial \Omega$ and by $\mathcal{D}(\overline{Q}\times]0, T[)$ the restrictions of functions from $\mathcal{D}(\mathbb{R}^n\times]0, T[)$ to $Q\times]0, T[$. Analogous notations are used for Ω and B and $\mathcal{D}(\overline{B}\times[0,T[)$ is the space of restrictions of functions from $\mathcal{D}(\mathbb{R}^n\times]-\infty, T[)$ to $B\times]0, T[$.

We use the anisotropic Sobolev spaces from [22]. For $r, s \ge 0$ we write

$$H^{r,s}(\mathcal{X}) := L^2(0,T,H^r(\mathcal{X})) \cap H^s(0,T,L^2(\mathcal{X})) \text{ for } \mathcal{X} \in \{B,\Omega,Q,\partial B,\partial \Omega\}$$

and for $s < \frac{1}{2}$ and $\mathcal{X} \in \{\partial B, \partial \Omega\}$

$$H^{-r,-s}(\mathcal{X}) := (H^{r,s}(\mathcal{X}))'.$$

The inner product on a real Hilbert space H is denoted by (\cdot, \cdot) and the dual pairing on $H' \times H$ by $\langle \cdot, \cdot \rangle$. They are related by the isometry $\iota_H : H \to H'$ that "identifies H with its dual", i.e. $\langle \iota_H u, \cdot \rangle := (u, \cdot)$ for all $u \in H$. Throughout this work we rigorously distinguish between the dual operator (denoted by A') and the adjoint operator (denoted by A^*) of an operator $A \in \mathcal{L}(H_1, H_2)$ between real Hilbert spaces H_1, H_2 . They satisfy the identity $A^* = \iota_{H_1}^{-1} A' \iota_{H_2}$, cf. figure 2.1.

We summarize some known properties of the Dirichlet and Neumann traces for solutions of the Laplace resp. heat equation. On the boundary $\partial\Omega$ we use the superscript ⁻, when the trace is taken from inside the inclusion Ω , and the superscript ⁺ when it is taken from the outside.

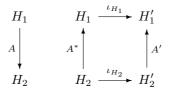

FIG. 2.1. Relation between dual and adjoint operator

THEOREM 2.1.

(a) The trace mapping

$$v \mapsto v|_{\partial B} \text{ resp. } v \mapsto v^+|_{\partial \Omega}, \quad v \in \mathcal{D}(\overline{Q} \times]0, T[),$$

can be extended to a continuous mapping from $H^{1,0}(Q)$ to $H^{\frac{1}{2},0}(\partial B)$ resp. to $H^{\frac{1}{2},0}(\partial \Omega)$, that has a continuous right inverse.

- The same holds for $H^{1,0}(\Omega) \to H^{\frac{1}{2},0}(\partial\Omega), v \mapsto v^-|_{\partial\Omega}$.
- (b) The Neumann traces $\kappa \partial_{\nu} v|_{\partial B}$ and $\kappa \partial_{\nu} v^{+}|_{\partial \Omega}$ are defined for every $v \in H^{1,0}(Q)$ that solves

(2.3)
$$\nabla \cdot (\kappa \, \nabla v) = 0 \ in \ Q \times]0, T[$$

by setting

$$\langle \kappa \partial_{\nu} v |_{\partial B}, f \rangle := \int_{0}^{T} \int_{Q} \kappa \, \nabla v \cdot \nabla v_{f} \, \mathrm{d}x \, \mathrm{d}t,$$
$$\langle \kappa \partial_{\nu} v^{+} |_{\partial \Omega}, \phi \rangle := - \int_{0}^{T} \int_{Q} \kappa \, \nabla v \cdot \nabla v_{\phi} \, \mathrm{d}x \, \mathrm{d}t$$

for every function f on ∂B and every function ϕ on $\partial \Omega$ that have extensions $v_f, v_\phi \in \mathcal{D}(\overline{Q} \times]0, T[)$ with $v_f|_{\partial B} = f, v_f|_{\partial \Omega} = 0$ resp. $v_\phi|_{\partial B} = 0, v_\phi|_{\partial \Omega} = \phi$. The Neumann traces can be extended to continuous mappings from the subspace of solutions of equation (2.3) (equipped with the $H^{1,0}(Q)$ -norm) to $H^{-\frac{1}{2},0}(\partial B)$ resp. $H^{-\frac{1}{2},0}(\partial \Omega)$.

(c) The Neumann trace $\kappa \partial_{\nu} v^{-}|_{\partial\Omega}$ is defined for every $v \in H^{1,0}(\Omega)$ that solves

(2.4)
$$\partial_t v - \nabla \cdot (\kappa \,\nabla v) = 0 \text{ in } \Omega \times]0, T$$

by setting

$$\langle \kappa \partial_{\nu} v^{-} |_{\partial \Omega}, \phi \rangle := \int_{0}^{T} \int_{\Omega} \kappa \, \nabla v \cdot \nabla v_{\phi} \, \mathrm{d}x \, \mathrm{d}t - \int_{0}^{T} \int_{\Omega} v \, \partial_{t} v_{\phi} \, \mathrm{d}x \, \mathrm{d}t$$

for every function ϕ on $\partial\Omega$ that has an extensions $v_{\phi} \in \mathcal{D}(\overline{\Omega} \times]0, T[)$ with $v_{\phi}|_{\partial\Omega} = \phi$.

The Neumann trace can be extended to a continuous mapping from the subspace of solutions of (2.4) (equipped with the $H^{1,0}(\Omega)$ -norm) to $H^{-\frac{1}{2},-\frac{1}{4}}(\partial\Omega)$.

Proof. (a), (b) immediately follow from the classical trace theorems on H^1 . For (c) we refer to [8].

Denoting

$$[v]_{\partial\Omega} := v^+|_{\partial\Omega} - v^-|_{\partial\Omega}$$
 and $[\kappa\partial_\nu v]_{\partial\Omega} := \kappa\partial_\nu v^+|_{\partial\Omega} - \kappa\partial_\nu v^-|_{\partial\Omega}$

we can write (2.1) as a diffraction problem:

LEMMA 2.2. $u \in H^{1,0}(B)$ solves (2.1) if and only if $u \in H^{1,0}(B \setminus \partial \Omega)$ solves

- (2.5) $\partial_t u \nabla \cdot (\kappa \nabla u) = 0 \ in \ \Omega \times]0, T[$
- (2.6) $\nabla \cdot (\kappa \, \nabla u) = 0 \ in \ Q \times]0, T[$
- (2.7) $[\kappa \partial_{\nu} u]_{\partial\Omega} = 0$

$$(2.8) [u]_{\partial\Omega} = 0$$

In particular equations (2.6) and (2.7) imply that $\kappa \partial_{\nu} u^{-}|_{\partial\Omega}$ can be extended by continuity to $H^{-\frac{1}{2},0}(\partial\Omega)$.

Proof. Like in the stationary case we have $u \in H^{1,0}(B)$ if and only if $u \in H^{1,0}(B \setminus \partial \Omega)$ and u satisfies (2.8). The rest immediately follows from the definition of distributional derivatives and the Neumann traces. \Box

The next lemma shows uniqueness for the diffraction problem with Neumann boundary condition and an initial condition on Ω . With respect to the Gelfand triple $H^1(\Omega) \hookrightarrow L^2(\Omega) \hookrightarrow H^1(\Omega)'$ we denote by

$$W := W(0, T, H^1(\Omega), H^1(\Omega)'),$$

the space of functions $u \in L^2(0, T, H^1(\Omega))$ with vector-valued distributional time derivative $u' \in L^2(0, T, H^1(\Omega)')$. From [10, Chp. XVIII], it follows that

$$W \subset C^0([0,T], L^2(\Omega)).$$

LEMMA 2.3. Let $u \in H^{1,0}(B \setminus \partial \Omega)$ solve (2.5), (2.6) and

(2.9)
$$[\kappa \partial_{\nu} u]_{\partial \Omega} = \psi \in H^{-\frac{1}{2},0}(\partial \Omega)$$

$$[u]_{\partial\Omega} = f \in H^{\frac{1}{2},0}(\partial\Omega)$$

(2.11)
$$\kappa \partial_{\nu} u|_{\partial B} = g \in H^{-\frac{1}{2},0}(\partial B)$$

Then $u|_{\Omega} \in W$ and u is uniquely determined by ψ , f, g and the initial condition

$$(2.12) u(x,0) = 0 \ on \ \Omega.$$

Proof. Again (2.9) implies that the Neumann trace $\kappa \partial_{\nu} u^{-}|_{\partial\Omega}$ can be extended by continuity to $H^{-\frac{1}{2},0}(\partial\Omega)$.

Thus we can define $w \in L^2(0, T, H^1(\Omega)')$ by setting for every $t \in]0, T[$ and $v \in H^1(\Omega)$

$$\langle w(t), v \rangle := \langle \kappa \partial_{\nu} u^{-}(t) |_{\partial \Omega}, v^{-} |_{\partial \Omega} \rangle - \int_{\Omega} \kappa \nabla u(t) \cdot \nabla v \, \mathrm{d}x.$$

We have

$$\int_{\Omega} \left(-\int_{0}^{T} u \,\partial_{t} \varphi \,\mathrm{d}t \right) v \,\mathrm{d}x$$
$$= \int_{0}^{T} \langle \kappa \partial_{\nu} u^{-} |_{\partial\Omega}, v^{-} |_{\partial\Omega} \rangle \varphi \,\mathrm{d}t - \int_{0}^{T} \int_{\Omega} \kappa \nabla u \cdot \nabla v \,\mathrm{d}x \,\varphi \,\mathrm{d}t$$
$$= \left\langle \int_{0}^{T} w \varphi \,\mathrm{d}t, v \right\rangle$$

for all $v(x)\varphi(t) \in \mathcal{D}(\overline{\Omega} \times]0, T[)$ and thus by continuous extension for all $v\varphi \in H^1(\Omega) \otimes \mathcal{D}(]0, T[)$. Thus in the sense of vector-valued distributions

$$w = (u|_{\Omega})'$$
 with respect to $H^1(\Omega) \hookrightarrow L^2(\Omega) \hookrightarrow H^1(\Omega)'$

and hence $u|_{\Omega} \in W \subset C^0([0,T], L^2(\Omega)).$

To show uniqueness let $f=0,\,\psi=0,\,g=0$ and (2.12). Since Green's formula holds for functions in W we have

$$\begin{split} \frac{1}{2} \int_{\Omega} |u(T)|^2 \, \mathrm{d}x &= \int_0^T \langle u'(t), u(t) \rangle \, \mathrm{d}t \\ &= \int_0^T \langle \kappa \partial_{\nu} u^- |_{\partial\Omega}, u^- |_{\partial\Omega} \rangle \, \mathrm{d}t - \int_0^T \int_{\Omega} \kappa |\nabla u|^2 \, \mathrm{d}x \, \mathrm{d}t \\ &= -\int_0^T \int_B \kappa |\nabla u|^2 \, \mathrm{d}x \, \mathrm{d}t. \end{split}$$

This implies that u(x,t) = c(t) where $c \in C^0([0,T],\mathbb{R})$ solves c' = 0 and c(0) = 0. Thus u = 0. \Box

To show existence of a solution we proceed analogously to [8, Lemma 2.3] by using Lions' projection lemma:

LEMMA 2.4. Lions' projection lemma

Assume that H is a Hilbert space and Φ is a subspace of H. Moreover let $a: H \times \Phi \rightarrow \mathbb{R}$ be a bilinear form satisfying the following properties:

- a) For every $\varphi \in \Phi$, the linear form $u \mapsto a(u, \varphi)$ is continuous on H.
- b) There exists $\alpha > 0$ such that $a(\varphi, \varphi) \ge \alpha \|\varphi\|_{H}^{2}$ for all $\varphi \in \Phi$.

Then for each continuous linear form $l \in H'$, there exists $u_0 \in H$ such that

$$a(u_0, \varphi) = \langle l, \varphi \rangle \text{ for all } \varphi \in \Phi \quad and \quad \|u_0\|_H \le \frac{1}{\alpha} \|l\|_{H'}.$$

Proof. The lemma is proven in [20]. We repeat the proof for the sake of completeness: From assumption a) and the Riesz representation theorem it follows that for every $\varphi \in \Phi$ there exists $K\varphi \in H$ with

$$(u, K\varphi) = a(u, \varphi)$$
 for all $u \in H$.

This defines a linear (possibly unbounded) operator $K: \Phi \to V := K(\Phi) \subseteq H$. From assumption b) it follows that K is injective and thus possesses an inverse $R_0: V \to \Phi$. Again using assumption b) we have

$$||R_0v||^2 \le \frac{1}{\alpha}a(R_0v, R_0v) = \frac{1}{\alpha}(R_0v, v) \le \frac{1}{\alpha}||R_0v|| \, ||v||$$

which yields $||R_0v|| \leq \frac{1}{\alpha} ||v||$. Thus R_0 can be extended by continuity to the closure \overline{V} of V. If we denote this extension by \overline{R}_0 then we have $\overline{R}_0 : \overline{V} \to \overline{\Phi}$.

 $\overline{\Phi}$ is a closed subspace of the Hilbert space H and thus also a Hilbert space. Using the Riesz representation theorem on $\overline{\Phi}$ we obtain a $\xi_l \in \overline{\Phi}$ with

$$l(\varphi) = (\xi_l, \varphi)$$
 for all $\varphi \in \overline{\Phi}$.

Finally let $P: H \to \overline{V}$ be the orthogonal projection onto \overline{V} then $u_0 := P^* \overline{R_0}^* \xi_l$ has the desired properties. \Box

We prove existence of a solution of the parabolic-elliptic diffraction problem (2.5), (2.6), (2.9)–(2.12) under the additional assumption that g and ψ have vanishing integral mean. For $\mathcal{X} \in \{\partial B, \partial \Omega\}$ we define

$$H_{\diamond}^{-\frac{1}{2}}(\mathcal{X}) := \{ g \in H^{-\frac{1}{2}}(\mathcal{X}) : \langle g, \mathbb{1}_{\mathcal{X}} \rangle = 0 \} \quad \text{and} \quad H_{\diamond}^{-\frac{1}{2},0}(\mathcal{X}) := L^{2}(0,T,H_{\diamond}^{-\frac{1}{2}}(\mathcal{X})).$$

Again they are Hilbert spaces because they are closed subspaces of $H^{-\frac{1}{2}}(\mathcal{X})$ resp. $H^{-\frac{1}{2},0}(\mathcal{X})$.

LEMMA 2.5. For every

$$g \in H^{-\frac{1}{2},0}_{\diamond}(\partial B), \ f \in H^{\frac{1}{2},0}(\partial \Omega) \ and \ \psi \in H^{-\frac{1}{2},0}_{\diamond}(\partial \Omega)$$

there exists $u \in H^{1,0}(B \setminus \partial \Omega)$ that solves (2.5), (2.6), (2.9)–(2.12). u depends continuously on g, f and ψ and it fulfills

$$\int_{\Omega} u(x,t) \, \mathrm{d}x = 0 \quad \text{ for } t \in [0,T] \text{ a. e}$$

Proof. Let $\gamma_{\partial\Omega}^-$: $H^{\frac{1}{2}}(\partial\Omega) \to H^1(Q)$ be a lifting operator, i.e. a continuous right inverse of the trace operator $\cdot|_{\partial\Omega}$ with $(\gamma_{\partial\Omega}^-h)|_{\partial B} = 0$ for all $h \in H^{\frac{1}{2}}(\partial\Omega)$ and set $u_f = \gamma_{\partial\Omega}^- f \in H^{1,0}(Q)$.

We define the spaces

$$H^{1}_{\square}(B) := \left\{ v \in H^{1}(B) : \int_{\Omega} v \, \mathrm{d}x = 0 \right\}, \qquad H := L^{2}(0, T, H^{1}_{\square}(B)),$$
$$\Phi := \left\{ \varphi \in \mathcal{D}([0, T[\times \overline{B}) : \int_{\Omega} \varphi \, \mathrm{d}x = 0 \right\},$$

and set for all $v \in H$ and $\varphi \in \Phi$

$$\begin{aligned} a(v,\varphi) &:= \int_0^T \int_B \kappa \nabla v \cdot \nabla \varphi \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \int_\Omega v \, \partial_t \varphi \, \mathrm{d}x \, \mathrm{d}t, \\ \langle l,v \rangle &:= -\int_0^T \int_Q \kappa \nabla u_f \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t + \int_0^T \langle g,v|_{\partial B} \rangle \, \mathrm{d}t - \int_0^T \langle \psi,v|_{\partial \Omega} \rangle \, \mathrm{d}t. \end{aligned}$$

Since H is a closed subspace of $H^{1,0}(B)$, it is a Hilbert space. $\Phi \subset H$ and for every $\varphi \in \Phi$, the linear form $v \to a(v, \varphi)$ is continuous on H.

Poincaré's inequality yields that $\left(\int_B |\nabla v|^2 \, \mathrm{d}x\right)^{1/2}$ is an equivalent norm on $H^1_{\square}(B)$, thus there exists $\alpha > 0$ such that for all $\varphi \in \Phi$

$$\begin{aligned} a(\varphi,\varphi) &= \int_0^T \int_B \kappa |\nabla\varphi(x,t)|^2 \,\mathrm{d}x \,\mathrm{d}t + \frac{1}{2} \int_\Omega |\varphi(0,x)|^2 \,\mathrm{d}x \\ &\geq \int_0^T \int_B \kappa |\nabla\varphi|^2 \,\mathrm{d}x \,\mathrm{d}t \geq \alpha \, \|\varphi\|_H^2 \,. \end{aligned}$$

Moreover the continuity of the trace and lifting operators yields the existence of a constant C that does not depend on g, f and ψ such that for all $v \in H$

$$\begin{split} \langle l, v \rangle &\leq C \left(\left\| g \right\|_{H^{-\frac{1}{2},0}(\partial B)} + \left\| f \right\|_{H^{\frac{1}{2},0}(\partial \Omega)} + \left\| \psi \right\|_{H^{-\frac{1}{2},0}(\partial \Omega)} \right) \| v \|_{H^{1,0}(B)} \\ &= C \left(\left\| g \right\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial B)} + \left\| f \right\|_{H^{\frac{1}{2},0}(\partial \Omega)} + \left\| \psi \right\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial \Omega)} \right) \| v \|_{H} \end{split}$$

and thus $l \in H'$ with $\|l\|_{H'} \leq C \left(\|g\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial B)} + \|f\|_{H^{\frac{1}{2},0}(\partial \Omega)} + \|\psi\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial \Omega)} \right)$. Now Lemma 2.4 gives existence of $\tilde{u} \in H$ that solves

(2.13)
$$\int_{0}^{T} \int_{B} \kappa \nabla \tilde{u} \cdot \nabla \varphi \, \mathrm{d}x \, \mathrm{d}t - \int_{0}^{T} \int_{\Omega} \tilde{u} \, \partial_{t} \varphi \, \mathrm{d}x \, \mathrm{d}t \\ = -\int_{0}^{T} \int_{Q} \kappa \nabla u_{f} \cdot \nabla \varphi \, \mathrm{d}x \, \mathrm{d}t + \int_{0}^{T} \langle g, \varphi|_{\partial B} \rangle \, \mathrm{d}t - \int_{0}^{T} \langle \psi, \varphi|_{\partial \Omega} \rangle \, \mathrm{d}t$$

for all $\varphi \in \Phi$ and \tilde{u} depends continuously on l (and therefore on g, f and ψ). We define $u \in H^{1,0}(B \setminus \partial \Omega)$ by setting $u|_{\Omega} := \tilde{u}|_{\Omega}$ and $u|_{Q} := \tilde{u}|_{Q} + u_{f}$. Then u solves (2.10) and there exist constants C', C'' > 0 such that

$$\begin{aligned} \|u\|_{H^{1,0}(B\setminus\partial\Omega)} &\leq C'\left(\|\tilde{u}\|_{\Omega}\|_{H^{1,0}(\Omega)} + \|\tilde{u}\|_{Q}\|_{H^{1,0}(Q)} + \|u_{f}\|_{H^{1,0}(Q)}\right) \\ &\leq C''\left(\|\tilde{u}\|_{H} + \|u_{f}\|_{H^{1,0}(Q)}\right),\end{aligned}$$

thus u depends continuously on g, f and ψ .

Since $\int_{\Omega} \tilde{u}(x,t) dx = 0$ for $t \in [0,T]$ a.e. the left side of (2.13) vanishes for all $\varphi(x,t) = c(t) \in \mathcal{D}([0,T[\times\overline{B}])$. Due to our additional assumptions on g and ψ also the right side of (2.13) vanishes for those φ . Thus (2.13) holds for all $\varphi \in \Phi$ and for all $\varphi(x,t) = c(t)$, which shows that (2.13) holds for all $\varphi \in \mathcal{D}([0,T[\times\overline{B}])$ and we immediately obtain that u solves (2.5), (2.6), (2.9) and (2.11).

From Lemma 2.3 it follows that $\tilde{u}|_{\Omega} = u|_{\Omega} \in W$ and thus Green's formula holds. We obtain that for every $\varphi \in \mathcal{D}([0, T] \times B)$ with support in $[0, T] \times \Omega$

$$-\int_{\Omega} u(0)\varphi(0) \,\mathrm{d}x$$
$$=\int_{0}^{T}\int_{\Omega} u \,\partial_{t}\varphi \,\mathrm{d}x \,\mathrm{d}t + \int_{0}^{T} \langle u', \varphi \rangle \,\mathrm{d}t$$

$$= \int_0^T \int_\Omega \tilde{u} \,\partial_t \varphi \,\mathrm{d}x \,\mathrm{d}t + \int_0^T \langle \kappa \partial_\nu u^- |_{\partial\Omega}, \varphi |_{\partial\Omega} \rangle \,\mathrm{d}t - \int_0^T \int_\Omega \kappa \nabla u \cdot \nabla \varphi \,\mathrm{d}x \,\mathrm{d}t \\ = \int_0^T \int_B \kappa \nabla \tilde{u} \cdot \nabla \varphi \,\mathrm{d}x \,\mathrm{d}t - \int_0^T \int_\Omega \kappa \nabla u \cdot \nabla \varphi \,\mathrm{d}x \,\mathrm{d}t \\ = 0,$$

where we used that the right side of (2.13) vanishes for $\operatorname{supp} \varphi \in [0, T[\times \Omega. \text{ As } \mathcal{D}(\Omega)]$ is dense in $L^2(\Omega)$ this yields that $u|_{\Omega}(0) = 0$. \Box

We summarize the results of this section and give a useful variational formulation in Sobolev spaces:

THEOREM 2.6. Let $g \in H_{\diamond}^{-\frac{1}{2},0}(\partial B)$, $f \in H^{\frac{1}{2},0}(\partial \Omega)$, $\psi \in H_{\diamond}^{-\frac{1}{2},0}(\partial \Omega)$ and let $u_f \in H^{1,0}(B \setminus \partial \Omega)$ be such that $u_f|_{\partial B} = 0$, $u_f|_{\partial \Omega} = f$ and $u_f|_{\Omega} = 0$.

For $u \in H^{1,0}(B \setminus \partial \Omega)$ the following three problems are equivalent and possess the same unique solution. The solution depends continuously on g, f and ψ and it fulfills $\int_{\Omega} u(x,t) dx = 0$ for $t \in [0,T]$ a. e.

(a) u solves

(2.14)
$$\partial_t u - \nabla \cdot (\kappa \nabla u) = 0 \text{ in } \Omega \times]0, T[,$$

- (2.15) $\nabla \cdot (\kappa \,\nabla u) = 0 \ in \ Q \times]0, T[,$
- (2.16) $[\kappa \partial_{\nu} u]_{\partial \Omega} = \psi,$
- $(2.17) [u]_{\partial\Omega} = f,$
- (2.18) $\kappa \partial_{\nu} u|_{\partial B} = q,$
- (2.19) $u(x,0) = 0 \text{ in } \Omega.$

(b) $u|_{\Omega} \in W$, u(x,0) = 0 in Ω and $\tilde{u} := u - u_f$ solves

(2.20)
$$\int_{0}^{T} \langle (\tilde{u}|_{\Omega})', v|_{\Omega} \rangle \, \mathrm{d}t + \int_{0}^{T} \int_{B} \kappa \nabla \tilde{u} \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t \\ = \int_{0}^{T} \langle g, v|_{\partial B} \rangle \, \mathrm{d}t - \int_{0}^{T} \langle \psi, v|_{\partial \Omega} \rangle \, \mathrm{d}t - \int_{0}^{T} \int_{Q} \kappa \nabla u_{f} \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t$$

for all $v \in H^{1,0}(B)$. (c) $\tilde{u} := u - u_f$ solves

$$\int_0^T \int_B \kappa \nabla \tilde{u} \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \langle (v|_\Omega)', \tilde{u}|_\Omega \rangle \, \mathrm{d}t$$
$$= \int_0^T \langle g, v|_{\partial B} \rangle \, \mathrm{d}t - \int_0^T \langle \psi, v|_{\partial \Omega} \rangle \, \mathrm{d}t - \int_0^T \int_Q \kappa \nabla u_f \nabla v \, \mathrm{d}x \, \mathrm{d}t$$

for all $v \in H^{1,0}(B)$ with $v|_{\Omega} \in W$ and v(x,T) = 0 on Ω .

Proof. We showed the unique solvability of the equations in (a) and the properties of the solution in Lemma 2.3 and Lemma 2.5. Thus it only remains to prove the equivalence of (a), (b) and (c).

(a) \Rightarrow (b): Note that $\tilde{u} \in H^{1,0}(B)$, $\kappa \partial_{\nu} u^{-}|_{\partial\Omega} \in H^{-\frac{1}{2},0}(\partial\Omega)$ and by Lemma 2.3 $\tilde{u}|_{\Omega} = u|_{\Omega} \in W.$

It suffices to show (2.20) for $v \in \mathcal{D}(]0, T[\times \overline{B})$. (2.14) and (2.15) imply that

$$0 = \int_0^T \langle (\tilde{u}|_{\Omega})', v|_{\Omega} \rangle \, \mathrm{d}t - \int_0^T \langle \nabla \cdot (\kappa \, \nabla u|_{\Omega}), v|_{\Omega} \rangle \, \mathrm{d}t$$
$$= \int_0^T \langle (\tilde{u}|_{\Omega})', v|_{\Omega} \rangle \, \mathrm{d}t - \int_0^T \langle \kappa \, \partial_\nu u^-|_{\partial\Omega}, v|_{\partial\Omega} \rangle \, \mathrm{d}t + \int_0^T \int_{\Omega} \kappa \, \nabla u \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t$$

and

$$0 = \int_0^T \langle \nabla \cdot (\kappa \, \nabla u |_Q) , v |_Q \rangle \, \mathrm{d}t$$

= $-\int_0^T \langle \kappa \, \partial_\nu u^+ |_{\partial\Omega}, v |_{\partial\Omega} \rangle \, \mathrm{d}t + \int_0^T \langle \kappa \, \partial_\nu u |_{\partial B}, v |_{\partial B} \rangle \, \mathrm{d}t$
 $-\int_0^T \int_Q \kappa \, \nabla u \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t.$

Subtracting these two equations and using (2.16) and (2.18) gives

$$0 = \int_0^T \langle (\tilde{u}|_{\Omega})', v|_{\Omega} \rangle \, \mathrm{d}t + \int_0^T \langle \psi, v|_{\partial\Omega} \rangle \, \mathrm{d}t - \int_0^T \langle g, v|_{\partial B} \rangle \, \mathrm{d}t + \int_0^T \int_{\Omega} \kappa \, \nabla u \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t + \int_0^T \int_Q \kappa \, \nabla u \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t.$$

Now (2.20) follows from

$$\int_0^T \int_\Omega \kappa \,\nabla u \cdot \nabla v \,\mathrm{d}x \,\mathrm{d}t + \int_0^T \int_Q \kappa \,\nabla u \cdot \nabla v \,\mathrm{d}x \,\mathrm{d}t$$
$$= \int_0^T \int_B \kappa \nabla \tilde{u} \cdot \nabla v \,\mathrm{d}x \,\mathrm{d}t + \int_0^T \int_Q \kappa \,\nabla u_f \cdot \nabla v \,\mathrm{d}x \,\mathrm{d}t.$$

(b) \Rightarrow (c): Follows from Green's formula on W. (c) \Rightarrow (a): was shown in the proof of Lemma 2.5.

2.2. Boundary measurements and a reference problem. We assume that the inclusion does not only have a higher heat capacity but also a higher conductivity κ than the background. For simplicity we fix $\kappa = 1$ on Q and therefore require that $\kappa|_{\Omega} - 1 \in L^{\infty}_{+}(\Omega)$.

We introduce the measurement operator

 $\Lambda_1: g \mapsto u_1|_{\partial B}$, where u_1 solves (2.1) with $\partial_{\nu} u_1|_{\partial B} = g$, $u_1|_{\Omega} = 0$ at t = 0.

Using the results from Section 2.1 we know that Λ_1 is a continuous linear operator from $H_{\diamond}^{-\frac{1}{2},0}(\partial B)$ to $H^{\frac{1}{2},0}(\partial B)$.

To locate the inclusion Ω we compare Λ_1 with boundary measurements of a domain without inclusions, i.e. with the measurement operator

 $\Lambda_0: g \mapsto u_0|_{\partial B}$, where $\Delta u_0 = 0$ on $B \times]0, T[$ and $\partial_{\nu} u_0|_{\partial B} = g$.

Lax-Milgram's theorem shows that u_0 is uniquely determined up to addition of a spatially constant function $u(x,t) = c(t) \in L^2(0,T,\mathbb{R})$ and that Λ_0 is a continuous

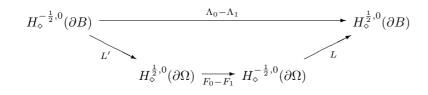

FIG. 3.1. Factorization of $\Lambda_0 - \Lambda_1$

linear operator from $H^{-\frac{1}{2},0}_{\diamond}(\partial B)$ to $H^{\frac{1}{2},0}_{\diamond}(\partial B) := L^2(0,T,H^{\frac{1}{2}}_{\diamond}(\partial B))$, where the quotient space $H^{\frac{1}{2}}_{\diamond}(\partial B) := H^{\frac{1}{2}}(\partial B)/\mathbb{R}$ can be identified with the dual space of $H^{-\frac{1}{2}}_{\diamond}(\partial B)$ and $H^{\frac{1}{2},0}_{\diamond}(\partial B)$ with the dual space of $H^{-\frac{1}{2},0}_{\diamond}(\partial B)$.

Analogously we define quotient spaces on B, Q and $\partial\Omega$ and note that in the case that $\partial\Omega$ is disconnected the quotient space $H^{\frac{1}{2}}_{\diamond}(\partial\Omega)$ is still obtained by factoring out the one-dimensional space of functions that are constant on $\partial\Omega$, and not the multidimensional space of functions that are constant on each connected component. Mathematically the elements of the quotient spaces $H^{r,0}_{\diamond}$, $r \geq 0$, are equivalence classes, i. e. all functions that differ only by a spatially constant function are called equivalent and combined into one class. For the sake of readability we write an equivalence class as a function and keep in mind that it is a representant of its class. We also note that the space $H^{-\frac{1}{2},0}_{\diamond}$, which we defined earlier, is not a quotient space.

Without changing notation we use the canonical epimorphism to restrict Λ_1 to the spaces of the reference problem. Thus we will investigate the inverse problem of locating the inclusion Ω from knowledge of

$$\Lambda_0, \Lambda_1: \ H^{-\frac{1}{2},0}_{\diamond}(\partial B) \to H^{\frac{1}{2},0}_{\diamond}(\partial B).$$

3. The inverse Problem. We use the Factorization Method to reconstruct Ω from the boundary measurements. To this end we show that the difference of the measurement operators $\Lambda_0 - \Lambda_1$ can be factorized into the product

(3.1)
$$\Lambda_0 - \Lambda_1 = L(F_0 - F_1)L',$$

cf. figure 3.1, where the operator L corresponds to virtual measurements on the complement Q of the inclusion, and its range contains all information about Q and thus about the location of Ω .

Unlike previously known applications of the Factorization Method the explicit timedependence of the problem prevents us from calculating $\mathcal{R}(L)$ from the boundary measurements, but using a new approach we can show that the knowledge of $\Lambda_0 - \Lambda_1$ still suffices to determine Ω .

3.1. Factorization of the boundary measurements. We define a virtual measurement operator that corresponds to inducing a heat flux on the inclusion's boundary

$$L: H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega) \to H^{\frac{1}{2},0}_{\diamond}(\partial B), \quad L\psi := v|_{\partial B},$$

where $v \in H^{1,0}_{\diamond}(Q)$ solves

(3.2)
$$\Delta v = 0 \text{ in } Q \times]0, T[, \quad \partial_{\nu} v = \begin{cases} -\psi & \text{ on } \partial\Omega, \\ 0 & \text{ on } \partial B. \end{cases}$$

We also need the two auxiliary operators

$$\begin{split} F_0: \ H^{\frac{1}{2},0}(\partial\Omega) \to H^{-\frac{1}{2},0}(\partial\Omega), \quad F_0\phi &:= \partial_{\nu}v_0^+|_{\partial\Omega}, \\ F_1: \ H^{\frac{1}{2},0}(\partial\Omega) \to H^{-\frac{1}{2},0}(\partial\Omega), \quad F_1\phi &:= \partial_{\nu}v_1^+|_{\partial\Omega}, \end{split}$$

where $v_0, v_1 \in H^{1,0}(B \setminus \partial \Omega)$ solve

(3.3)
$$\begin{aligned} \Delta v_0 &= 0 \text{ in } (Q \cup \Omega) \times]0, T[, \qquad [\partial_{\nu} v_0]_{\partial \Omega} &= 0, \\ \partial_{\nu} v_0|_{\partial B} &= 0, \qquad \qquad [v_0]_{\partial \Omega} &= \phi, \end{aligned}$$

and

$$\begin{array}{rcl} \Delta v_1 &=& 0 \text{ in } Q \times]0, T[, & [\kappa \partial_{\nu} v_1]_{\partial \Omega} &=& 0, \\ (3.4) & \partial_t v_1 - \nabla \cdot (\kappa \nabla v_1) &=& 0 \text{ in } \Omega \times]0, T[, & [v_1]_{\partial \Omega} &=& \phi, \\ v_1(x,0) &=& 0 \text{ in } \Omega, & \partial_{\nu} v_1|_{\partial B} &=& 0. \end{array}$$

Note that F_0 is well defined even though (3.3) determines v_0 only up to addition of a spatially constant function. Since the ranges of F_0 and F_1 are contained in $H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)$ and their kernels contain $L^2(0,T,\mathbb{R})$, we will consider them as operators from

$$H^{\frac{1}{2},0}_{\diamond}(\partial\Omega)$$
 into $H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)$.

THEOREM 3.1. The difference of the boundary measurements can be factorized into

$$\Lambda_0 - \Lambda_1 = L(F_0 - F_1)L'.$$

The operators L and L' are injective.

Proof. For given $g \in H^{-\frac{1}{2},0}_{\diamond}(\partial B)$ let $w \in H^{1,0}_{\diamond}(Q)$ solve

$$\Delta w = 0 \text{ in } Q \times]0, T[\text{, with } \partial_{\nu} w = \begin{cases} 0 & \text{on } \partial\Omega\\ g & \text{on } \partialB \end{cases}$$

Let $\psi \in H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)$ and $v \in H^{1,0}_{\diamond}(Q)$ be the solution of (3.2) in the definition of $L\psi$. Then

$$\begin{aligned} \langle \psi, L'g \rangle &= \langle g, L\psi \rangle = \langle \partial_{\nu} w |_{\partial B}, v |_{\partial B} \rangle = \int_{0}^{T} \int_{Q} \nabla w \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t \\ &= \langle -\partial_{\nu} v^{+} |_{\partial \Omega}, w^{+} |_{\partial \Omega} \rangle = \langle \psi, w^{+} |_{\partial \Omega} \rangle \,, \end{aligned}$$

thus $L'g = w^+|_{\partial\Omega}$.

Now let $v_0, v_1 \in H^{1,0}(B \setminus \partial \Omega)$ be the solutions of (3.3) resp. (3.4) from the definition of $F_0 w^+|_{\partial\Omega}$ resp. $F_1 w^+|_{\partial\Omega}$. We define $u_0, u_1 \in H^{1,0}(B \setminus \partial\Omega)$ by setting $u_i|_{\Omega} := -v_i|_{\Omega}$ and $u_i|_Q := w - v_i|_Q$, i = 0, 1. Then $u_0, u_1 \in H^{1,0}(B)$ and solve the equations in the definitions of $\Lambda_0 g$ and $\Lambda_1 g$. Thus

$$(\Lambda_0 - \Lambda_1)g = (u_0 - u_1)|_{\partial B} = -(v_0 - v_1)|_{\partial B}.$$

Since $\Delta(v_1 - v_0) = 0$ in $Q \times]0, T[$ and $\partial_{\nu}(v_1 - v_0)|_{\partial B} = 0$ we also have

$$L(\partial_{\nu}(v_0^+ - v_1^+)|_{\partial\Omega}) = -(v_0 - v_1)|_{\partial B},$$

and thus

$$(\Lambda_0 - \Lambda_1)g = L(\partial_\nu (v_0^+ - v_1^+)|_{\partial\Omega}) = L(F_0 - F_1)w^+|_{\partial\Omega} = L(F_0 - F_1)L'g.$$

To show injectivity of L' let L'g = 0 with some $g \in H^{-\frac{1}{2},0}_{\diamond}(\partial B)$. Then we obtain from the above characterization of L' a solution $w \in H^{1,0}(Q)$ of

$$\Delta w = 0 \quad \text{in } Q \times]0, T[, \qquad w^+|_{\partial\Omega} = 0 \quad \text{and} \quad \partial_\nu w = \begin{cases} 0 & \text{on } \partial\Omega, \\ g & \text{on } \partial B. \end{cases}$$

We set w to zero on $\Omega \times]0, T[$ and denote this continuation by $\tilde{w} \in H^{1,0}(B \setminus \partial \Omega)$. Then we have

$$\Delta \tilde{w} = 0 \quad \text{in } (B \setminus \partial \Omega) \times]0, T[, \qquad [\tilde{w}]_{\partial \Omega} = 0, \qquad [\kappa \partial_{\nu} \tilde{w}]_{\partial \Omega} = 0,$$

and thus $\tilde{w} \in H^{1,0}(B)$ and $\Delta \tilde{w} = 0$ in $B \times]0, T[$. Hence $\tilde{w}(\cdot, t)$ is analytic for $t \in]0, T[$ a.e. Since \tilde{w} disappears on Ω and B is connected, we obtain that $w = \tilde{w} = 0$ in Q, so that g = 0. Thus L' is injective.

The injectivity of L follows from the same arguments, when the function from the definition of L is set to zero in $(\mathbb{R}^n \setminus \overline{B}) \times]0, T[$. Since Q is connected, also $\mathbb{R}^n \setminus \overline{\Omega}$ is connected. \Box

The injectivity of L and L' yields that they have dense ranges. The operator $F_0 - F_1$ satisfies a coerciveness condition, to show this we introduce the operators λ_1 and λ , that correspond to measurements on the inclusion resp. on its complement.

$$\lambda_{1}: H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega) \to H^{\frac{1}{2},0}(\partial\Omega), \quad \lambda_{1}\psi := u_{1}^{-}|_{\partial\Omega},$$
$$\lambda: H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega) \to H_{\diamond}^{\frac{1}{2},0}(\partial\Omega), \quad \lambda\psi := u^{+}|_{\partial\Omega},$$

where $u_1 \in W$ solves

(3.5)
$$\partial_t u_1 - \nabla \cdot (\kappa \nabla u_1) = 0$$
 in $\Omega \times]0, T[, \quad \kappa \partial_\nu u_1^-|_{\partial\Omega} = \psi, \quad u_1(x,0) = 0$ on Ω ,
and $u \in H^{1,0}_{\diamond}(Q)$ solves

$$\Delta u = 0 \text{ in } Q \times]0, T[, \quad \partial_{\nu} u = \begin{cases} -\psi & \text{on } \partial\Omega, \\ 0 & \text{on } \partial B. \end{cases}$$

The unique solvability of (3.5) is shown in [8, Cor. 3.17] for general $\psi \in H^{-\frac{1}{2},-\frac{1}{4}}(\partial \Omega)$. In our case it can also be proven analogously to Lemma 2.3 and Lemma 2.5.

Again we use the canonical epimorphism to restrict λ_1 to the same spaces as λ , i.e. from now on we consider it as an operator

$$\lambda_1: H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega) \to H^{\frac{1}{2},0}_{\diamond}(\partial\Omega).$$

Lemma 3.2.

(a) For every $\psi \in H_{\diamond}^{-\frac{1}{2},0}(\partial \Omega)$ we have the identity

$$\langle \psi, \lambda_1 \psi \rangle = \int_0^T \langle (u_1|_{\Omega})', u_1|_{\Omega} \rangle \,\mathrm{d}t + \int_0^T \int_{\Omega} \kappa |\nabla u_1|^2 \,\mathrm{d}x \,\mathrm{d}t$$

where $u_1 \in W$ is the solution of (3.5) in the definition of λ_1 . (b) λ_1 is coercive with respect to $H^{-\frac{1}{2},-\frac{1}{4}}(\partial\Omega)$, i. e. there exists c > 0 such that

(3.6)
$$\langle \psi, \lambda_1 \psi \rangle \ge c \|\psi\|_{H^{-\frac{1}{2}, -\frac{1}{4}}(\partial\Omega)}^2$$
 for all $\psi \in H_{\diamond}^{-\frac{1}{2}, 0}(\partial\Omega).$

Proof. By setting it to zero on Q every solution $u_1 \in W$ of (3.5) can be extended to a solution of the equations (2.14), (2.15) and (2.19) in Theorem 2.6(a), with

$$[\kappa \partial_{\nu} u_1]_{\partial \Omega} = -\psi, \qquad [u_1]_{\partial \Omega} = -\lambda_1 \psi \quad \text{and} \quad \kappa \partial_{\nu} u_1|_{\partial B} = 0.$$

It follows that

(3.7)
$$\int_{\Omega} u_1(x,t) \, \mathrm{d}x = 0 \quad \text{for } t \in [0,T] \text{ a. e.}$$

and with $u_f \in H^{1,0}(B \setminus \partial \Omega)$ such that $u_f|_{\partial B} = 0$, $u_f|_{\partial \Omega} = -\lambda_1 \psi$ and $u_f|_{\Omega} = 0$ we obtain from the variational formulation for $\tilde{u} := u_1 - u_f$ in Theorem 2.6(b)

$$\int_0^T \langle (\tilde{u}|_{\Omega})', \tilde{u}|_{\Omega} \rangle \,\mathrm{d}t + \int_0^T \int_B \kappa |\nabla \tilde{u}|^2 \,\mathrm{d}x \,\mathrm{d}t = \int_0^T \langle \psi, \tilde{u}|_{\partial\Omega} \rangle \,\mathrm{d}t - \int_0^T \int_Q \kappa \nabla u_f \cdot \nabla \tilde{u} \,\mathrm{d}x \,\mathrm{d}t.$$

Using $\tilde{u}|_{\partial\Omega} = \lambda_1 \psi$, $u_f|_{\Omega} = 0$ and $u_1|_Q = 0$ we conclude that

$$\langle \psi, \lambda_1 \psi \rangle = \int_0^T \langle (u_1|_\Omega)', u_1|_\Omega \rangle \,\mathrm{d}t + \int_0^T \int_\Omega \kappa |\nabla u_1|^2 \,\mathrm{d}x \,\mathrm{d}t,$$

and thus (a) holds.

Because of (3.7) Poincaré's inequality yields the existence of a c' > 0 such that

$$\langle \psi, \lambda_1 \psi \rangle \ge c' \| u_1 \|_{H^{1,0}(\Omega)}^2,$$

and so assertion (b) follows from the continuity of the Neumann trace in Theorem 2.1(c). $\hfill\square$

LEMMA 3.3. There exists c' > 0 such that

$$\langle (F_0 - F_1)\phi, \phi \rangle \ge c' \|F_1\phi\|_{H^{-\frac{1}{2}, -\frac{1}{4}}(\partial\Omega)}^2.$$

and F_1 is bijective with $F_1^{-1} = -\lambda - \lambda_1$.

Proof. For given $\phi \in H^{\frac{1}{2},0}(\partial\Omega)$ let $v_0, v_1 \in H^{1,0}(B \setminus \partial\Omega)$ be the solutions of (3.3) and (3.4) in the definition of F_0 and F_1 and let $v_\phi \in H^{1,0}(B \setminus \partial\Omega)$ be such that $v_\phi^+|_{\partial\Omega} = \phi$, $v_\phi|_{\partial B} = 0$ and $v_\phi|_{\Omega} = 0$.

Then $\tilde{v}_i := v_i - v_{\phi}, i = 0, 1$, solve

$$\int_0^T \int_B \nabla \tilde{v}_0 \cdot \nabla w \, \mathrm{d}x \, \mathrm{d}t = -\int_0^T \int_Q \nabla v_\phi \cdot \nabla w \, \mathrm{d}x \, \mathrm{d}t,$$
$$\int_0^T \langle (\tilde{v}_1|_\Omega)', w|_\Omega \rangle \, \mathrm{d}t + \int_0^T \int_B \kappa \nabla \tilde{v}_1 \cdot \nabla w \, \mathrm{d}x \, \mathrm{d}t = -\int_0^T \int_Q \nabla v_\phi \cdot \nabla w \, \mathrm{d}x \, \mathrm{d}t$$

for all $w \in H^{1,0}(B)$ (cf. Theorem 2.6 for the second equation). From Lax-Milgram's theorem it follows that for $t \in]0, T[$ a.e. $\tilde{v}_0(\cdot, t)$ minimizes the functional

$$w \mapsto \frac{1}{2} \int_{B} |\nabla w(x)|^2 \, \mathrm{d}x + \int_{Q} \nabla v_{\phi}(x,t) \cdot \nabla w(x) \, \mathrm{d}x$$

in $H^1(B)$, so that

$$\begin{split} &\int_0^T \int_B |\nabla \tilde{v}_0|^2 \,\mathrm{d}x \,\mathrm{d}t \\ &= -2 \left(-\frac{1}{2} \int_0^T \int_B |\nabla \tilde{v}_0|^2 \,\mathrm{d}x \,\mathrm{d}t + \int_0^T \int_Q \nabla v_\phi \cdot \nabla \tilde{v}_0 \,\mathrm{d}x \,\mathrm{d}t \right) \\ &\geq -2 \left(\frac{1}{2} \int_0^T \int_B |\nabla \tilde{v}_1|^2 \,\mathrm{d}x \,\mathrm{d}t + \int_0^T \int_Q \nabla v_\phi \cdot \nabla \tilde{v}_1 \,\mathrm{d}x \,\mathrm{d}t \right) \\ &= -\int_0^T \int_B |\nabla \tilde{v}_1|^2 \,\mathrm{d}x \,\mathrm{d}t + 2 \int_0^T \int_B \kappa |\nabla \tilde{v}_1|^2 \,\mathrm{d}x \,\mathrm{d}t + 2 \int_0^T \langle (\tilde{v}_1|_\Omega)', \tilde{v}_1|_\Omega \rangle \,\mathrm{d}t \end{split}$$

and thus

$$\begin{split} \langle (F_0 - F_1)\phi, \phi \rangle \\ &= \langle \partial_{\nu} v_0^+, \phi \rangle - \langle \partial_{\nu} v_1^+, \phi \rangle = \int_0^T \int_Q \nabla v_1 \cdot \nabla v_\phi \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \int_Q \nabla v_0 \cdot \nabla v_\phi \, \mathrm{d}x \, \mathrm{d}t \\ &= \int_0^T \int_Q \nabla v_\phi \cdot \nabla \tilde{v}_1 \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \int_Q \nabla v_\phi \cdot \nabla \tilde{v}_0 \, \mathrm{d}x \, \mathrm{d}t \\ &= \int_0^T \int_B |\nabla \tilde{v}_0|^2 \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \int_B \kappa |\nabla \tilde{v}_1|^2 \, \mathrm{d}x \, \mathrm{d}t - \int_0^T \langle (\tilde{v}_1|_\Omega)', \tilde{v}_1|_\Omega \rangle \, \mathrm{d}t \\ &\geq \int_0^T \int_\Omega (\kappa - 1) |\nabla \tilde{v}_1|^2 \, \mathrm{d}x \, \mathrm{d}t + \int_0^T \langle (\tilde{v}_1|_\Omega)', \tilde{v}_1|_\Omega \rangle \, \mathrm{d}t. \end{split}$$

Using $\kappa|_{\Omega} - 1 \in L^{\infty}_{+}(\Omega)$, $\int_{0}^{T} \langle (\tilde{v}_{1}|_{\Omega})', \tilde{v}_{1}|_{\Omega} \rangle dt \geq 0$, $\tilde{v}_{1}|_{\Omega} = v_{1}|_{\Omega}$ and Lemma 3.2(a) we conclude that there exists $c_{\kappa} > 0$ such that

$$\langle (F_0 - F_1)\phi, \phi \rangle \geq c_{\kappa} \left(\int_0^T \int_{\Omega} \kappa |\nabla \tilde{v}_1|^2 + \int_0^T \langle (\tilde{v}_1|_{\Omega})', \tilde{v}_1|_{\Omega} \rangle \, \mathrm{d}t \right)$$

= $c_{\kappa} \left\langle \left(\kappa \partial_{\nu} \tilde{v}_1^-|_{\partial\Omega} \right), \lambda_1 \left(\kappa \partial_{\nu} \tilde{v}_1^-|_{\partial\Omega} \right) \right\rangle = c_{\kappa} \left\langle \left(\partial_{\nu} v_1^+|_{\partial\Omega} \right), \lambda_1 \left(\partial_{\nu} v_1^+|_{\partial\Omega} \right) \right\rangle$
= $c_{\kappa} \left\langle F_1 \phi, \lambda_1 F_1 \phi \right\rangle,$

and so the first assertion follows from Lemma 3.2(b). To show surjectivity of F_1 let $\psi \in H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)$ and denote by $u \in H^{1,0}(Q)$, $u_1 \in W$ the functions from the definition of $\lambda \psi$ and $\lambda_1 \psi$.

Define $v_1 \in H^{1,0}(B \setminus \partial\Omega)$ by setting $v_1 := -u$ on Q and $v_1 := u_1$ on Ω . Then v_1 solves the equations in the definition of F_1 with $[v_1]_{\partial\Omega} = (-\lambda - \lambda_1)\psi$ (up to a spatially constant function) and thus $F_1(-\lambda - \lambda_1)\psi = \partial_{\nu}u_1^+|_{\partial\Omega} = \psi$.

It remains to show injectivity of F_1 . To this end let $F_1\phi = 0$ and $v_1 \in H^{1,0}(B \setminus \partial \Omega)$ be the function from the definition of F_1 . Then v_1 solves the Laplace equation on Q and the heat equation on Ω each with zero Neumann boundary values. Thus it vanishes on Ω and is spatially constant on Q, which implies that $\phi \in L^2(0, T, \mathbb{R})$. \Box

3.2. Range characterization. Lemma 3.3 implies that the symmetric part of $F_0 - F_1$ is positive and thus also the symmetric part of $\Lambda_0 - \Lambda_1$ is positive. Identifying Hilbert spaces with their duals these operators have positive square roots, and their ranges can be related. The key to provide this relation is the following lemma, that has been used by Brühl to extend the Factorization Method to the case of non-constant conductivities in EIT [4, Satz 4.9]. We state it in the form as it is called the "14th important property of Banach spaces" in [3] and give an elementary proof for the sake of completeness:

LEMMA 3.4. Let X,Y be two Banach spaces, let $A \in \mathcal{L}(X;Y)$ and $x' \in X'$. Then

$$x' \in \mathcal{R}(A')$$
 if and only if $\exists C > 0 : |\langle x', x \rangle| \le C ||Ax|| \quad \forall x \in X.$

Proof. If $x' \in \mathcal{R}(A')$ then there exists $y' \in Y'$ such that x' = A'y'. Thus

$$|\langle x', x \rangle| = |\langle y', Ax \rangle| \le ||y'|| \, ||Ax|| \ \forall x \in X,$$

and the assertion holds with C = ||y'||.

Now let $x' \in X'$ such that there exists C > 0 with $|\langle x', x \rangle| \leq C ||Ax||$ for all $x \in X$. Define

$$f(z) := \langle x', x \rangle$$
 for every $z = Ax \in \mathcal{R}(A)$.

Then f is a well-defined, continuous linear functional, with $||f(z)|| \leq C ||z||$. Using the Hahn-Banach theorem there exists $y' \in Y'$ with $y'|_{\mathcal{R}(A)} = f$. For all $x \in X$ we have

$$\langle A'y', x \rangle = \langle y', Ax \rangle = f(A(x)) = \langle x', x \rangle$$

and thus $x' = A'y' \in \mathcal{R}(A')$.

We will make use of the following simple corollary:

COROLLARY 3.5. Let H_i , i = 1, 2, be Hilbert spaces with norms $\|\cdot\|_i$, X be a third Hilbert space and $A_i \in \mathcal{L}(X, H_i)$.

If $||A_1x||_1 \leq ||A_2x||_2$ for all $x \in X$ then $\mathcal{R}(A_1^*) \subseteq \mathcal{R}(A_2^*)$.

Proof. Since $A'_{i}\iota_{H_{1}} = \iota_{X}A^{*}_{i}$, $i = 1, 2, y \in \mathcal{R}(A^{*}_{1})$ implies $\iota_{X}y \in \mathcal{R}(A'_{1})$. Using Lemma 3.4 there exists C > 0 such that

$$\left|\langle \iota_X y, x \rangle\right| \le C \left\|A_1 x\right\|_1 \le C \left\|A_2 x\right\|_2 \ \forall x \in X.$$

and thus $\iota_X y \in \mathcal{R}(A'_2)$, which implies $y \in \mathcal{R}(A^*_2)$.

Note that in particular $A_1^*A_1 = A_2^*A_2$ implies $\mathcal{R}(A_1^*) = \mathcal{R}(A_2^*)$ (cf. [11]). Following the argumentation in [12] we can use Corollary 3.5 to characterize the range of the virtual measurement operator L by reformulating the symmetric part of (3.1) using adjoint operators.

We set

$$\begin{split} \Lambda &:= \Lambda_0 - \frac{1}{2} (\Lambda_1 + \Lambda_1'), \qquad \Lambda &= \Lambda \iota_{H_0^{1/2,0}(\partial B)}, \\ F &:= F_0 - \frac{1}{2} (F_1 + F_1'), \qquad \tilde{F} &= \iota_{H_0^{1/2,0}(\partial \Omega)}^{-1} F. \end{split}$$

LEMMA 3.6. $\tilde{\Lambda}$ and \tilde{F} are self-adjoint and positive operators and their square roots satisfy

$$\mathcal{R}(\tilde{\Lambda}^{1/2}) = \mathcal{R}(L\iota_{H^{1/2,0}_{\diamond}(\partial\Omega)}\tilde{F}^{1/2}).$$

Proof. By construction $\tilde{\Lambda}$ and \tilde{F} are self-adjoint and positive. From Theorem 3.1 it follows that

$$\begin{split} \tilde{\Lambda}^{1/2} \tilde{\Lambda}^{1/2} &= \tilde{\Lambda} = L \iota_{H^{1/2,0}_{\diamond}(\partial \Omega)} \tilde{F} L' \iota_{H^{1/2,0}_{\diamond}(\partial B)} \\ &= \left(L \iota_{H^{1/2,0}_{\diamond}(\partial \Omega)} \right) \tilde{F} \left(L \iota_{H^{1/2,0}_{\diamond}(\partial \Omega)} \right)^{*} \\ &= \left(L \iota_{H^{1/2,0}_{\diamond}(\partial \Omega)} \right) \tilde{F}^{1/2} \tilde{F}^{1/2} \left(L \iota_{H^{1/2,0}_{\diamond}(\partial \Omega)} \right)^{*} \end{split}$$

The assertion now follows from Corollary 3.5. $\hfill \Box$

If F was coercive with respect to the space $H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)$ we would obtain surjectivity of $\tilde{F}^{1/2}$ and thus the range characterization $\mathcal{R}(\tilde{\Lambda}^{1/2}) = \mathcal{R}(L)$ that was used in previous applications of the Factorization Method. In our situation we only have the weaker coercivity condition from Lemma 3.3. The next theorem shows that this weaker condition is still enough to guarantee that $\mathcal{R}(\tilde{F}^{1/2})$ contains all functions of a certain time regularity, which turns out to be sufficient for the method to work.

THEOREM 3.7.

(3.8)
$$\mathcal{R}(\tilde{\Lambda}^{1/2}) \subseteq \mathcal{R}(L) = L\left(H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)\right)$$

(3.9)
$$\mathcal{R}(\tilde{\Lambda}^{1/2}) \supseteq \qquad L\left(H^{\frac{1}{4}}(0,T,H^{-\frac{1}{2}}_{\diamond}(\partial\Omega))\right).$$

Proof. Equation (3.8) immediately follows from Lemma 3.6.

Denote by $j: H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega) \hookrightarrow H^{-\frac{1}{2},-\frac{1}{4}}(\partial\Omega)$ the imbedding operator. Using Lemma 3.3 we have for all $\phi \in H_{\diamond}^{\frac{1}{2},0}(\partial\Omega)$

$$\left\|\tilde{F}^{1/2}\phi\right\|_{H^{\frac{1}{2},0}_{\diamond}(\partial\Omega)}^{2} = \left(\tilde{F}\phi,\phi\right)_{H^{\frac{1}{2},0}_{\diamond}(\partial\Omega)} \ge c'\left\|jF_{1}\phi\right\|_{H^{-\frac{1}{2},-\frac{1}{4}}(\partial\Omega)}^{2}$$

Since $F_1^* j^* = \iota_{H^{1/2,0}_{\diamond}(\partial\Omega)}^{-1} F_1' j' \iota_{H^{-1/2,-1/4}(\partial\Omega)}$ we obtain from Corollary 3.5

$$\mathcal{R}\left(\tilde{F}^{1/2}\right) \supseteq \mathcal{R}(F_1^*j^*) = \mathcal{R}\left(\iota_{H_{\diamond}^{1/2,0}(\partial\Omega)}^{-1}F_1'j'\right),$$

and from Lemma 3.6

$$\mathcal{R}(\tilde{\Lambda}^{1/2}) = \mathcal{R}(L\iota_{H^{1/2,0}_{\diamond}(\partial\Omega)}\tilde{F}^{1/2}) \supseteq \mathcal{R}(LF'_{1}j').$$

Using Lemma 3.4 it is easily seen that

$$\mathcal{R}(j') = H^{\frac{1}{2}, \frac{1}{4}}_{\diamond}(\partial\Omega) := (H^{\frac{1}{2}, \frac{1}{4}}(\partial\Omega) + L^{2}(0, T, \mathbb{R}))/L^{2}(0, T, \mathbb{R}) \subset H^{\frac{1}{2}, 0}_{\diamond}(\partial\Omega).$$

(Note that by this definition $H^{\frac{1}{2},\frac{1}{4}}_{\diamond}(\partial\Omega)$ is isomorphic to $H^{\frac{1}{2},\frac{1}{4}}(\partial\Omega)/H^{\frac{1}{4}}(0,T,\mathbb{R})$.)

Using Lemma 3.3 we have $(F'_1)^{-1} = -\lambda' - \lambda'_1$. Since $\lambda = \lambda'$ and $\mathcal{R}(\lambda'_1) \subseteq H^{\frac{1}{2},\frac{1}{4}}_{\diamond}(\partial\Omega)$ (cf. [8]) it only remains to show that

(3.10)
$$\lambda\left(H^{\frac{1}{4}}(0,T,H_{\diamond}^{-\frac{1}{2}}(\partial\Omega))\right) \subseteq H_{\diamond}^{\frac{1}{2},\frac{1}{4}}(\partial\Omega).$$

To this end denote by $\overline{\lambda}: H_{\diamond}^{-\frac{1}{2}}(\partial\Omega) \to H_{\diamond}^{\frac{1}{2}}(\partial\Omega), \overline{\psi} \mapsto \overline{u}^+|_{\partial\Omega}$, where $\overline{u} \in H_{\diamond}^1(Q)$ solves

$$\Delta \overline{u} = 0 \text{ in } Q, \quad \partial_{\nu} \overline{u} = \begin{cases} -\overline{\psi} & \text{on } \partial\Omega, \\ 0 & \text{on } \partial B. \end{cases}$$

Then for every $\psi \in H^1(0, T, H^{-\frac{1}{2}}_{\diamond}(\partial \Omega))$ and $\varphi \in \mathcal{D}(]0, T[)$

$$\begin{split} \int_0^T (-1)(\lambda\psi)\varphi' \,\mathrm{d}t &= \overline{\lambda} \left(\int_0^T (-1)\psi\varphi'(t) \,\mathrm{d}t \right) = \overline{\lambda} \left(\int_0^T \psi'\varphi(t) \,\mathrm{d}t \right) \\ &= \int_0^T (\lambda\psi')\varphi \,\mathrm{d}t \in H^{\frac{1}{2}}_\diamond(\partial\Omega) \end{split}$$

Thus $\lambda \psi \in H^1(0, T, H^{\frac{1}{2}}_{\diamond}(\partial \Omega))$ with $(\lambda \psi)' = \lambda(\psi')$, which shows that λ is not only a continuous operator from $L^2(0, T, H^{-\frac{1}{2}}_{\diamond}(\partial \Omega))$ to $L^2(0, T, H^{\frac{1}{2}}_{\diamond}(\partial \Omega))$ but also from $H^1(0, T, H^{-\frac{1}{2}}_{\diamond}(\partial \Omega))$ to $H^1(0, T, H^{\frac{1}{2}}_{\diamond}(\partial \Omega))$.

By interpolation (cf. [21]) λ is a continuous operator from

$$H^{\frac{1}{4}}(0,T,H_{\diamond}^{-\frac{1}{2}}(\partial\Omega)) \to H^{\frac{1}{4}}(0,T,H_{\diamond}^{\frac{1}{2}}(\partial\Omega)) \subset H_{\diamond}^{\frac{1}{2},\frac{1}{4}}(\partial\Omega).$$

Thus (3.10) holds and the assertion follows.

3.3. Characterization of the inclusion. The composition of time integration and the (compact) imbedding $H^{\frac{1}{2}}_{\diamond}(\partial B) \hookrightarrow L^{2}_{\diamond}(\partial B) := L^{2}(\partial B)/\mathbb{R}$ defines the operator

$$I: \ H^{\frac{1}{2},0}_{\diamond}(\partial B) \to L^{2}_{\diamond}(\partial B), \quad u \mapsto \int_{0}^{T} u(\cdot,t) \, \mathrm{d}t$$

Identifying $L^2_{\diamond}(\partial B)$ with its dual we have

where $I': L^2_{\diamond}(\partial B) \to H^{-\frac{1}{2},0}_{\diamond}(\partial B)$ is given by

$$I'v = w$$
, with $w(\cdot, t) = v(\cdot)$ for $t \in [0, T]$ a.e.

18

The operator $I\Lambda I'$ corresponds to measurements of applying temporal constant (and spatially square integrable) heat fluxes to a body and measuring time integrals of the resulting temperature on the boundary.

We use the same dipole functions as Brühl and Hanke used in [13] for the implementation of the Factorization Method in EIT. For a direction $d \in \mathbb{R}^n$, |d| = 1 and a point $z \in B$ let

$$D_{z,d}(x) := \frac{(z-x) \cdot d}{|z-x|^n}.$$

Then $D_{z,d}(x)$ is analytic and $\Delta D_{z,d}(x) = 0$ in $\mathbb{R}^n \setminus \{z\}$. Moreover using a ball $B_{\epsilon}(z)$ centered at z with such small radius $\epsilon > 0$ such that $\overline{B_{\epsilon}(z)} \subset B$

$$\int_{\partial B} \partial_{\nu} D_{z,d}(x) \, \mathrm{d}x = \int_{\partial B_{\epsilon}(z)} \partial_{\nu} D_{z,d}(x) \, \mathrm{d}x = 0$$

so in particular $\partial_{\nu} D_{z,d} \in H_{\diamond}^{-\frac{1}{2}}(\partial B)$ and there exists $v_{z,d} \in H^1(B)$ that solves

$$\Delta v_{z,d} = 0$$
 in B and $\partial_{\nu} v_{z,d} = -\partial_{\nu} D_{z,d}$ on ∂B .

Now $H_{z,d} := D_{z,d} + v_{z,d}$ is harmonic (and thus analytic) in $B \setminus \{z\}$ with $\partial_{\nu} H_{z,d}|_{\partial B} = 0$ but $H_{z,d} \notin L^2(B \setminus \{z\})$. The inclusion can now be characterized by the traces $h_{z,d} := H_{z,d}|_{\partial B} \in H_{\diamond}^{\frac{1}{2}}(\partial B)$ (again we use the same notation for the equivalence class of functions that are identical up to addition of constant functions as we used for the original function).

THEOREM 3.8. For every $d \in \mathbb{R}^n$, |d| = 1 and $z \in B$

$$z \in \Omega$$
 if and only if $h_{z,d} \in \mathcal{R}\left((I\Lambda I')^{1/2}\right)$.

Proof. From Corollary 3.5 and (3.11) it follows that $\mathcal{R}((I\Lambda I')^{1/2}) = \mathcal{R}(I\Lambda^{1/2})$ and consequently from Theorem 3.7 we obtain

$$\begin{aligned} \mathcal{R}\left((I\Lambda I')^{1/2}\right) &\subseteq IL\left(H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)\right)\\ \mathcal{R}\left((I\Lambda I')^{1/2}\right) &\supseteq IL\left(H^{\frac{1}{4}}(0,T,H_{\diamond}^{-1/2}(\partial\Omega))\right). \end{aligned}$$

First let $z \in \Omega$, then we define $w \in H^{1,0}_{\diamond}(Q)$ by $w(x,t) := H_{z,d}(x)/T$ for $t \in [0,T]$ a.e. Then $-\partial_{\nu}w^+|_{\partial\Omega} \in H^{\frac{1}{4}}(0,T,H^{-1/2}_{\diamond}(\partial\Omega))$ and w solves equation (3.2) in the definition of L, so

$$h_{z,d} = Iw|_{\partial B} = IL(-\partial_{\nu}w^{+}|_{\partial\Omega})$$

$$\in IL\left(H^{\frac{1}{4}}(0,T,H^{-1/2}_{\diamond}(\partial\Omega))\right) \subseteq \mathcal{R}\left((I\Lambda I')^{1/2}\right)$$

To show the converse let $h_{z,d} \in \mathcal{R}\left((I\Lambda I')^{1/2}\right) \subseteq IL(H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega))$. Then $h_{z,d}$ coincides with the integral of the trace of a solution of the Laplace equation on Q with vanishing Neumann boundary values. Taking the integral of that solution we have that $h_{z,d} = w|_{\partial B}$, with some

$$w \in H^1_{\diamond}(Q)$$
, that solves $\Delta w = 0$ on Q , $\partial_{\nu} w = 0$ on ∂B .

As $H_{z,d}$ and w are both harmonic on $Q \setminus \{z\}$ with the same Cauchy data on ∂B , they coincide near ∂B and thus by analytic continuation on $Q \setminus \{z\}$. If $z \notin \Omega$ this leads to the contradiction that $w \in L^2_\diamond(Q \setminus \{z\})$ but $H_{z,d} \notin L^2_\diamond(Q \setminus \{z\})$. \Box

By construction $I\Lambda I'$ is a compact and self-adjoint operator and from the factorization and the positiveness of F it follows that it is positive. Since $I\Lambda I'g = 0$ implies that $\langle FL'I'g, L'I'g \rangle = 0$ and thus L'I'g = 0, we also obtain injectivity of $I\Lambda I'$ from the injectivity of L' and I'. Hence there exists an orthonormal basis $(v_k)_{k\in\mathbb{N}}$ of eigenfunctions with associated positive eigenvalues $(\lambda_k)_{k\in\mathbb{N}}$. Following [13] we use this spectral decomposition to reformulate Theorem 3.8 with the Picard criterion:

COROLLARY 3.9. For every $d \in \mathbb{R}^n$, |d| = 1 and $z \in B$

$$z \in \Omega$$
 if and only if $\sum_{k \in \mathbb{N}} \frac{1}{\lambda_k} \left(\int_{\partial B} h_{z,d} v_k \, \mathrm{d}x \right)^2 < \infty.$

We remark that the results of this subsection remain valid with identical proofs when I is replaced by

$$I_S: H^{\frac{1}{2},0}_{\diamond}(\partial B) \to L^2_{\diamond}(S), \quad u \mapsto \int_0^T u|_S(\cdot,t) \,\mathrm{d}t$$

where S is a relatively open subset of the boundary ∂B . Thus Ω is uniquely determined by $I_S \Lambda I'_S$, i. e. by measurements of applying (temporal constant) heat fluxes on a part of the boundary and measuring (time integrals of) the resulting temperature on the same part, cf. e.g. [14, 24, 25] for corresponding results in impedance tomography and the effect of partial boundary data on numerical reconstructions.

4. Numerics.

4.1. The direct problem. In this section we show how the direct problem can be solved numerically with a coupling of a finite element method and a boundary element method similar to [9]. We start by reformulating the direct problem.

4.1.1. Reformulation of the direct problem. Recall that λ was defined by

$$\lambda: \ H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega) \to H_{\diamond}^{\frac{1}{2},0}(\partial\Omega), \quad \lambda\psi := \eta^{+}|_{\partial\Omega},$$

where $\eta \in H^{1,0}_{\diamond}(Q)$ solves

$$\Delta \eta = 0 \text{ in } Q, \quad \partial_{\nu} \eta = \begin{cases} -\psi & \text{on } \partial \Omega, \\ 0 & \text{on } \partial B. \end{cases}$$

We use the same notation for the time-independent Neumann-Dirichlet-operator

$$\lambda: H_{\diamond}^{-\frac{1}{2}}(\partial\Omega) \to H_{\diamond}^{\frac{1}{2}}(\partial\Omega).$$

Note that λ is linear, continuous and coercive, i.e. $\langle \psi, \lambda \psi \rangle \geq c \|\psi\|_{H_0^{-\frac{1}{2}}(\partial\Omega)}^2$.

For the rest of this section we assume that $g \in H^{-\frac{1}{2},0}_{\diamond}(\partial B)$ and $\xi = \xi(g) \in H^{1,0}_{\diamond}(Q)$ solves

$$\Delta \xi = 0 \text{ in } Q, \quad \partial_{\nu} \xi = \begin{cases} 0 & \text{on } \partial \Omega, \\ g & \text{on } \partial B. \end{cases}$$

THEOREM 4.1. If $u \in H^{1,0}(B)$ solves (2.5)–(2.8), (2.11) and (2.12) then $v := u|_{\Omega}$ and $\phi := -\kappa \partial_{\nu} u^{-}|_{\partial\Omega}$ satisfy

(4.1)
$$\partial_t v - \nabla \cdot (\kappa \nabla v) = 0 \ in \ \Omega \times]0, T[,$$

(4.2)
$$v^{-}|_{\partial\Omega} - \lambda \phi = \xi^{+}|_{\partial\Omega} \text{ in } H^{\frac{1}{2},0}_{\diamond}(\partial\Omega),$$

(4.3)
$$v(x,0) = 0 \text{ in } \Omega.$$

On the other hand if $(v, \phi) \in H^{1,0}(\Omega) \times H_{\diamond}^{-\frac{1}{2},0}(\partial \Omega)$ solves (4.1)-(4.3) and

(4.4)
$$\kappa \partial_{\nu} v^{-}|_{\partial \Omega} = -\phi,$$

then there exists $u \in H^{1,0}(B)$ that solves (2.5)–(2.8), (2.11), (2.12) and $v = u|_{\Omega}$. Moreover $u|_Q \in H^{1,0}(Q)$ is the representant of $\xi + \eta \in H^{1,0}_{\diamond}(Q)$ with $\int_{\partial\Omega} u^+|_{\partial\Omega} ds = \int_{\partial\Omega} u^-|_{\partial\Omega} ds$, where η is as in the definition of $\lambda\phi$.

Proof. The proof immediately follows from the definition of ξ and λ .

THEOREM 4.2. The following problems are equivalent:

 $\begin{array}{l} (a) \ (u,\phi) \in H^{1,0}(\Omega) \times H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega) \ solves \ (4.1) - (4.4). \\ (b) \ (u,\phi) \in W \times H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega), \ u(x,0) = 0 \ in \ \Omega \ and \ (u,\phi) \ solves \end{array}$

(4.5)
$$\int_{0}^{T} \langle u', v \rangle \, \mathrm{d}t + \int_{0}^{T} \int_{\Omega} \kappa \nabla u \cdot \nabla v \, \mathrm{d}x \, \mathrm{d}t + \int_{0}^{T} \langle \phi, v^{-}|_{\partial\Omega} \rangle \, \mathrm{d}t \\ - \int_{0}^{T} \langle \tilde{\psi}, \lambda \phi \rangle \, \mathrm{d}t + \int_{0}^{T} \langle \tilde{\psi}, u^{-}|_{\partial\Omega} \rangle \, \mathrm{d}t = \int_{0}^{T} \langle \tilde{\psi}, \xi^{+}|_{\partial\Omega} \rangle \, \mathrm{d}t$$

for all $v \in H^{1,0}(\Omega)$ and for all $\tilde{\psi} \in H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)$.

(c) $(u,\phi) \in W \times H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega), u(x,0) = 0 \text{ in } \Omega \text{ and } (u,\phi) \text{ solves}$

for $t \in [0,T]$ a.e. and for all $v \in H^1(\Omega)$ and for all $\tilde{\psi} \in H^{-\frac{1}{2}}_{\diamond}(\partial\Omega)$.

Proof. (a) \Leftrightarrow (b) can be shown analogously to the proof of Theorem 2.6.

To show (b) \Leftrightarrow (c), note that (4.6) is fulfilled for $t \in [0, T]$ a.e. if and only if it is fulfilled in the sense of $L^2([0, T])$. The equivalence then follows from the fact that $L^2([0, T]) \otimes H^1(\Omega)$, resp. $L^2([0, T]) \otimes H_{\diamond}^{-\frac{1}{2}}(\partial \Omega)$ are dense in $H^{1,0}(\Omega)$, resp. $H_{\diamond}^{-\frac{1}{2},0}(\partial \Omega)$.

4.1.2. Implementation and convergence analysis of the reformulated problem. Let $\{H_h, h > 0\}$ and $\{B_h, h > 0\}$, be families of finite dimensional subspaces of $H^1(\Omega)$ and $H_{\diamond}^{-\frac{1}{2}}(\partial\Omega)$, respectively. Accordingly the family of L^2 -projections $P_h: H^1(\Omega) \to H_h$ is defined by $\int_{\Omega} P_h v w_h dx = \int_{\Omega} v w_h dx$ for all $w_h \in H_h$. We assume that P_h satisfies the following estimate: There exists a constant $\gamma > 0$, independent of h, such that

(4.7)
$$\sup_{v \in H^{1}(\Omega)} \frac{\|P_{h}v\|_{H^{1}(\Omega)}}{\|v\|_{H^{1}(\Omega)}} \leq \gamma \text{ for all } h > 0.$$

For example let \mathcal{T} be a regular triangulation of Ω with generic mesh spacing h and H_h be a space of piecewise linear polynomials on \mathcal{T} . Then following [23] the operator P_h fulfills (4.7).

We consider the following Galerkin scheme:

Find $u_h: [0,T] \to H_h, \phi_h: [0,T] \to B_h$ such that

(4.8)
$$\langle u'_h, v_h \rangle + \int_{\Omega} \kappa \nabla u_h \cdot \nabla v_h \, \mathrm{d}x + \langle \phi_h, v_h^- |_{\partial\Omega} \rangle - \langle \psi_h, \lambda \phi_h \rangle + \langle \psi_h, u_h^- |_{\partial\Omega} \rangle = \langle \psi_h, \xi^+ |_{\partial\Omega} \rangle$$

for all $(v_h, \psi_h) \in H_h \times B_h$, $t \in [0, T]$ a.e. and $u_h(0) = 0$.

LEMMA 4.3. For every h > 0 the Galerkin scheme (4.8) has a unique solution in $H_h^T \times B_h^T$, where

$$\begin{split} H_h^T &:= \left\{ u \in L^2(0, T, H_h) : u' \in L^2(0, T, H_h), u(x, 0) = 0 \right\} \subset W, \\ B_h^T &:= L^2(0, T, B_h) \subset H_\diamond^{-\frac{1}{2}, 0}(\partial \Omega). \end{split}$$

Proof. Let $(w_k)_{k=1}^{n_h}$ be a basis of H_h which is orthonormal with respect to the $L^2(\Omega)$ scalar product and $(\psi_j)_{j=1}^{m_h}$ be a basis of B_h . Moreover if we write $u_h(x,t) = \sum_{k=1}^{n_h} \alpha_k(t) w_k(x)$ and $\phi_h(x,t) = \sum_{j=1}^{m_h} \beta_j(t) \psi_j(x)$, then (4.8) is equivalent to

(4.9)
$$\partial_t \alpha(t) + K \alpha(t) + B \beta(t) = 0, \quad \alpha(0) = 0,$$

and

(4.10)
$$D\beta(t) - B^T \alpha(t) = d(t).$$

where $\alpha = (\alpha_1, \ldots, \alpha_{n_h})^T$ and $\beta = (\beta_1, \ldots, \beta_{m_h})^T$. Since λ is linear and coercive we can solve (4.10) for β in terms of α and substitute into (4.9) to obtain a system of ODEs for α . According to standard existence theory for ODEs, there exists a unique absolutely continuous solution α .

LEMMA 4.4. Assume that $(w_h, \zeta_h) \in H_h^T \times B_h^T$, $\zeta \in H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)$, $w \in W$ with w(x, 0) = 0 in Ω . Moreover assume that the following equation is fulfilled

$$\langle w'_h, v_h \rangle + \int_{\Omega} \kappa \nabla w_h \cdot \nabla v_h \, \mathrm{d}x + \langle \zeta_h, v_h^- |_{\partial\Omega} \rangle - \langle \psi_h, \lambda \zeta_h \rangle + \langle \psi_h, w_h^- |_{\partial\Omega} \rangle$$

$$(4.11) \qquad = \langle w', v_h \rangle + \int_{\Omega} \kappa \nabla w \cdot \nabla v_h \, \mathrm{d}x + \langle \zeta, v_h^- |_{\partial\Omega} \rangle - \langle \psi_h, \lambda \zeta \rangle + \langle \psi_h, w^- |_{\partial\Omega} \rangle$$

for $t \in [0,T]$ a.e. and for all $(v_h, \psi_h) \in H_h \times B_h$. Then there exists c > 0 independent of h such that

$$\|w_{h}\|_{W} + \|\zeta_{h}\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} \le c\left(\|w\|_{W} + \|\zeta\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right)$$

Proof.

1. We use $(v_h, \psi_h) = (w_h, -\zeta_h)$ in (4.11) and obtain for $t \in [0, T]$ a.e.

$$\begin{split} \langle w_h', w_h \rangle &+ \int_{\Omega} \kappa |\nabla w_h|^2 \, \mathrm{d}x + \langle \zeta_h, \lambda \zeta_h \rangle \\ &= \langle w', w_h \rangle + \int_{\Omega} \kappa \nabla w \cdot \nabla w_h \, \mathrm{d}x + \langle \zeta, w_h^- |_{\partial\Omega} \rangle + \langle \zeta_h, \lambda \zeta \rangle - \langle \zeta_h, w^- |_{\partial\Omega} \rangle \\ &\leq c_1 \left(\|w'\|_{H^1(\Omega)'} + \|w\|_{H^1(\Omega)} + \|\zeta\|_{H_{\diamond}^{-\frac{1}{2}}(\partial\Omega)} \right) \|w_h\|_{H^1(\Omega)} \\ &+ c_2 \left(\|\zeta\|_{H_{\diamond}^{-\frac{1}{2}}(\partial\Omega)} + \|w\|_{H^1(\Omega)} \right) \|\zeta_h\|_{H_{\diamond}^{-\frac{1}{2}}(\partial\Omega)}, \end{split}$$

where c_i , i = 1, ..., 8 are not depending on h. Note that $\|\zeta\|_{H^{-\frac{1}{2}}(\partial\Omega)} = \|\zeta_h\|_{H^{-\frac{1}{2}}(\partial\Omega)}$ and $\|\zeta_h\|_{H^{-\frac{1}{2}}(\partial\Omega)} = \|\zeta_h\|_{H^{-\frac{1}{2}}(\partial\Omega)}$. Now we integrate the left and the right hand side of this inequality from 0 to t and get for $t \in [0, T]$ a.e.

$$\frac{1}{2} \|w_h(t)\|_{L^2(\Omega)}^2 + \int_0^t \int_\Omega \kappa |\nabla w_h|^2 \, \mathrm{d}x \, \mathrm{d}t + \int_0^t \langle \zeta_h, \lambda \zeta_h \rangle \, \mathrm{d}t$$

$$(4.12) \le c_3 \left(\|w\|_W + \|\zeta\|_{H_0^{-\frac{1}{2},0}(\partial\Omega)} \right) \left(\|w_h\|_{H^{1,0}(\Omega)} + \|\zeta_h\|_{H_0^{-\frac{1}{2},0}(\partial\Omega)} \right) \,.$$

Again integrating both sides of this inequality from 0 to ${\cal T}$ yields

$$\|w_h\|_{L^2(0,T,L^2(\Omega))}^2$$

$$(4.13) \le c_4 \left(\|w\|_W + \|\zeta\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right) \left(\|w_h\|_{H^{1,0}(\Omega)} + \|\zeta_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right)$$

2. Since λ is coercive, using (4.12) and (4.13) we get

$$\|w_h\|_{H^{1,0}(\Omega)}^2 + \|\zeta_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}^2$$

 $\leq c_5 \left(\|w\|_W + \|\zeta\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right) \left(\|w_h\|_{H^{1,0}(\Omega)} + \|\zeta_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right).$

Therefore we have

(4.14)
$$\|w_h\|_{H^{1,0}(\Omega)} + \|\zeta_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} \le c_6 \left(\|w\|_W + \|\zeta\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)}\right).$$

3. Since $w'_h \in H_h$ for $t \in [0,T]$ a.e., using the L^2 -projection P_h we have for $t \in [0,T]$ a.e.

(4.15)
$$\|w_h'\|_{H^1(\Omega)'} = \sup_{w \in H^1(\Omega)} \frac{\langle w_h', w \rangle}{\|w\|_{H^1(\Omega)}} = \sup_{w \in H^1(\Omega)} \frac{\langle w_h', P_h w \rangle}{\|w\|_{H^1(\Omega)}}$$

Now we use $(v_h, \psi_h) = (P_h w, 0)$ in (4.11) and obtain for $t \in [0, T]$ a.e.

$$\langle w_h', P_h w \rangle = -\int_{\Omega} \kappa \nabla w_h \cdot \nabla P_h w \, \mathrm{d}x - \langle \zeta_h, P_h w^- |_{\partial\Omega} \rangle + \langle w', P_h w \rangle$$
$$+ \int_{\Omega} \kappa \nabla w \cdot \nabla P_h w \, \mathrm{d}x + \langle \zeta, P_h w^- |_{\partial\Omega} \rangle$$

$$\leq c_7 \|P_h w\|_{H^1(\Omega)} \left(\|w_h\|_{H^1(\Omega)} + \|\zeta_h\|_{H^{-\frac{1}{2}}_{\diamond}(\partial\Omega)} + \|w\|_W + \|\zeta\|_{H^{-\frac{1}{2}}_{\diamond}(\partial\Omega)} \right).$$

Squaring and then integrating (4.15) from 0 to T and combining it with the inequality above, (4.7) and (4.14), we obtain

$$\|w_h'\|_{L^2(0,T,H^1(\Omega)')} \le c_8 \left(\|w\|_W + \|\zeta\|_{H_{\diamond}^{-\frac{1}{2},0}(\partial\Omega)} \right).$$

In particular Lemma 4.4 holds for (u_h, ϕ_h) and (u, ϕ) .

We proof a variant of Céa's Lemma for this time-dependent problem.

THEOREM 4.5. Assume that (u, ϕ) and (u_h, ϕ_h) are solutions of (4.5) with u(x, 0) = 0and of the Galerkin scheme, respectively. Then there exists c > 0 such that

$$\begin{aligned} \|u - u_h\|_W + \|\phi - \phi_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} \\ &\leq c \inf \left\{ \|u - z_h\|_W + \|\phi - \chi_h\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} : z_h \in H^T_h, \, \chi_h \in B^T_h \right\} \,. \end{aligned}$$

Proof. (u, ϕ) and (u_h, ϕ_h) obviously satisfy (4.11).

Let $(z_h, \chi_h) \in H_h^T \times B_h^T$ we set $(e_1, e_2) := (u_h, \phi_h) - (z_h, \chi_h)$ and $(\epsilon_1, \epsilon_2) := (u, \phi) - (z_h, \chi_h)$. Then (4.11) yields

$$\langle e_1', v_h \rangle + \int_{\Omega} \kappa \nabla e_1 \cdot \nabla v_h \, \mathrm{d}x + \langle e_2, v_h^- |_{\partial\Omega} \rangle - \langle \psi_h, \lambda e_2 \rangle + \langle \psi_h, e_1^- |_{\partial\Omega} \rangle$$
$$= \langle \epsilon_1', v_h \rangle + \int_{\Omega} \kappa \nabla \epsilon_1 \cdot \nabla v_h \, \mathrm{d}x + \langle \epsilon_2, v_h^- |_{\partial\Omega} \rangle - \langle \psi_h, \lambda \epsilon_2 \rangle + \langle \psi_h, \epsilon_1^- |_{\partial\Omega} \rangle$$

for all $(v_h, \psi_h) \in H_h \times B_h$ and for $t \in [0, T]$ a.e., Lemma 4.4 shows that

$$\|e_1\|_W + \|e_2\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} \le c_1 \left(\|\epsilon_1\|_W + \|\epsilon_2\|_{H^{-\frac{1}{2},0}_{\diamond}(\partial\Omega)} \right)$$

Hence

$$\| (u_h, \phi_h) - (u, \phi) \|_{W \times H_{\diamond}^{-\frac{1}{2}, 0}(\partial \Omega)}$$

 $\leq c_2 \inf \left\{ \| (u, \phi) - (z_h, \chi_h) \|_{W \times H_{\diamond}^{-\frac{1}{2}, 0}(\partial \Omega)} : z_h \in H_h^T, \, \chi_h \in B_h^T \right\}$

which is the desired estimate.

For our numerical examples we choose the same subspaces as in [9] and [23], i.e. H_h consists of continuous functions, which are piecewise linear on a finite element grid and B_h consists of piecewise constant functions. (4.9), (4.10) are solved numerically by a Crank-Nicolson method, i.e. we solve in each time-step the linear system of equations

$$\begin{bmatrix} I + \frac{\Delta t}{2}K & \frac{\Delta t}{2}B \\ -\frac{1}{2}B^T & \frac{1}{2}D \end{bmatrix} \begin{bmatrix} \alpha(t+\Delta t) \\ \beta(t+\Delta t) \end{bmatrix} = \begin{bmatrix} I - \frac{\Delta t}{2}K & -\frac{\Delta t}{2}B \\ \frac{1}{2}B^T & -\frac{1}{2}D \end{bmatrix} \begin{bmatrix} \alpha(t) \\ \beta(t) \end{bmatrix} + \begin{bmatrix} 0 \\ d(t) \end{bmatrix},$$

with $\alpha(0) = 0$ and $\beta(0) = D^{-1}d(0)$.

For the calculation of ξ and λ we use a boundary element method.

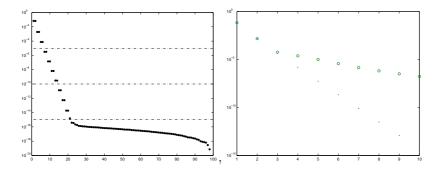

FIG. 4.1. Left: The exact eigenvalues $\tilde{\lambda}_k$ from A. Right: Exact (·) and perturbed (o) averaged eigenvalues.

4.2. Implementation of the inverse problem. In this subsection we demonstrate how the factorization method can be used to solve the inverse problem, i.e. to locate the inclusion Ω from the knowledge of $I\Lambda I'$. We assume that we are given a finite dimensional approximation of $I\Lambda I'$, thus a matrix $A \in \mathbb{R}^{m \times m}$. Let $(v_k)_{k \in \mathbb{N}}$, resp. $(\tilde{v}_k)_{k=1}^m$ be the eigenfunctions of $I\Lambda I'$, resp. A with associated eigenvalues $(\lambda_k)_{k \in \mathbb{N}}$, resp. $(\tilde{\lambda}_k)_{k \in \mathbb{N}}$. Since $I\Lambda I'$ is self-adjoint and positive the matrix A is symmetric and positive, too.

According to Corollary 3.9 a point $z\in B$ belongs to the inclusion Ω if and only if the infinite series

$$\sum_{k \in \mathbb{N}} \frac{(h_{z,d}, v_k)_{L^2(\partial B)}^2}{\lambda_k}$$

converges. For the numerical realization we have to decide about the convergence of this series from the knowledge of the finite sum

$$\sum_{k=1}^{m} \frac{(h_{z,d}, \tilde{v}_k)_{L^2(\partial B)}^2}{\tilde{\lambda}_k}$$

For that we carry forward the ideas from [4]. Numerical examples show, that the nominator and the denominator of the above series decay more or less exponentially and that every two eigenvalues have approximately the same value, c.f. left picture of figure 4.1. Motivated by the examples and the method from [4] we compare the slopes of the least squares fitting straight lines of $h_1(k) = \log\left(\sqrt{\tilde{\lambda}_{2k-1}\tilde{\lambda}_{2k}}\right)$ and of

$$h_2(k) = \log\left(\frac{1}{2}\left(\left(h_{z,d}, \tilde{v}_{2k-1}\right)_{L^2(\partial B)}^2 + \left(h_{z,d}, \tilde{v}_{2k}\right)_{L^2(\partial B)}^2\right)\right), \quad k = 1, \dots, r.$$

We mark a sampling point z as inside the inclusion, if h_1 decays slower than h_2 . On the right side of figure 4.2 the algorithm is demonstrated for two test points. If we apply this method to a large number of points, the black area on the left side of figure 4.2 illustrates the reconstruction of the inclusion (dashed curve).

The number of the eigenvalues and Fourier coefficients which are used in the reconstruction procedure depends on the quality of the data. If A is known up to a

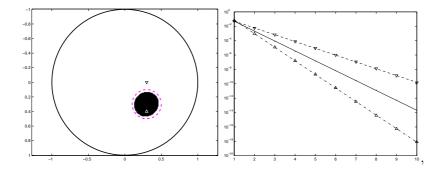

FIG. 4.2. Least squares fitting straight lines of $h_2(k)$ for a point inside (\triangle) and outside (\bigtriangledown) the inclusion compared with the least squares fitting straight line of $h_1(k)$ (·).

perturbation of $\delta > 0$ (with respect to the spectral norm), then we trust in those eigenvalues which are larger than δ . On the left side of figure 4.1, δ corresponds to the computational accuracy. The right side of figure 4.1 shows the effect of a relative noise of 0.1% on the eigenvalues, thus $\delta = 0.1\% \cdot \tilde{\lambda}_1$. The first three averaged pairs of the perturbed eigenvalues have nearly the exact values and they show the same exponential decay rates.

4.3. Numerical examples. To test this reconstruction algorithm we simulate the direct problem to produce the data. For this purpose we calculate the Dirichlet boundary data $f_k = I\Lambda I'g_k$, where $(g_k)_{k=1}^m$ are orthogonal input patterns. In the first examples this data was used for inversion. In the final example these data was perturbed with noise.

We restrict us to the case where $\kappa(x) = 2$ for $x \in \Omega$ and B is the unit disc in \mathbb{R}^2 . For this case the function $h_{z,d}$ is known explicitly

$$h_{z,d}(x) = \frac{1}{\pi} \frac{(z-x) \cdot d}{|z-x|^2}.$$

First we aim to reconstruct a single circle in the interior of B. The result is shown in the left picture of figure 4.2. The location of Ω is detected but the size is underestimated.

In the second example four inclusions of different size should be located. In figure 4.3 we demonstrate the possibility of the method to reconstruct non connected inclusions. The position and the different size of each is detected.

Our next example is to detect a non convex moon like inclusion, c.f. figure 4.4. The top left picture shows the reconstruction with exact data. The shape of the moon is recovered but the size is underestimated. Next we show the influence of noise to the reconstructions. By adding 0.05%, 0.1%, resp., 1% noise the position of the inclusion is found, but the quality decreases with increasing noise level, c.f. the top right and bottom pictures in figure 4.4.

The last example shows the reconstruction of a single circle by partial boundary measurements (cf. our remark at the end of section 3). The location of the inclusion is detected and the shape next to the measuring boundary is recovered, see figure 4.5.

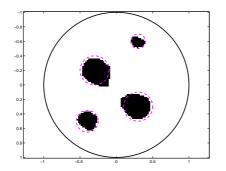

FIG. 4.3. Reconstruction of four inclusions (dashed curves).

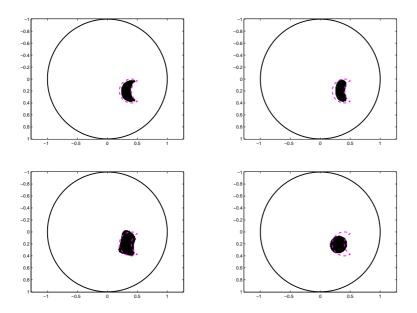

FIG. 4.4. Reconstruction of a non convex inclusion (dashed curve), top left: with exact data, and with perturbed data, top right: 0.05% noise, bottom left: 0.1% noise, bottom right: 1% noise.

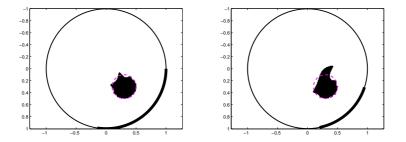

FIG. 4.5. Reconstruction of an inclusion (dashed curve) by using partial boundary measurements (bold boundary).

Acknowledgments. We thank Prof. Dr. Martin Hanke-Bourgeois and Prof. Dr. Olaf Steinbach for stimulating discussion and constructive remarks.
